

## **ABSTRACT**

A particle composition containing a continuous phase of 0.5-95% organically soluble cellulosic material selected from the group consisting of ethyl cellulose and hydroxypropyl cellulose dissolved in 5-99.5% organic fragrance chemicals and organic flavor chemicals. The particles are formed from a continuous phase product that results from dissolving the cellulosic material in the flavor/fragrance which is subsequently subjected to techniques to form the desired particle size. Methods of making and using the particles are also disclosed.
